Student declaration on the use of generative AI

Name: Nguyen Tan Phat Student ID: 105004201 Unit: COS30045 Data Visualisation
Assessment: Data Visualisation Critique

I used a generative AI assistant (OpenCode, running a large language model) as a collaborative tool while preparing this assessment. It was not used to produce the report on my own behalf; I directed the work, made every decision about content, and am responsible for the final report.

My own contribution: I selected the dashboard and the data set. I wrote the original draft, including all of the analysis in Section 1-4. I set the report structure, following the unit's suggested structure and the tip that the questions should act as prompts rather than headings. I supplied the Power BI link, took the screenshots, and provided the AIHW workbook. I tested the dashboard in Microsoft Edge myself, raised the point about the hover-only tooltip, and asked whether claims in the draft were worth keeping. I reviewed and accepted, rejected or changed every edit.

The assistant's contribution: it reformatted my draft into continuous essay prose and removed the headings and repeated question prompts, it reworded sentences at my request, it captured and added numbered markers to the figures (image editing), it located references and verified their details, it opened my AIHW workbook and checked the figures I cited and it reviewed the draft against the marking rubric. Some analytical sentences were drafted or reworded by the assistant at my request, including parts of the ethics, bias and interactivity passages. I read each of these, double-checked them against the sources, and adopted or amended them.

I have read the final report, checked each figure and citation against its source, and I can explain its content, its methods and its findings.

Appendix A: Prompts and outputs

Tool used: OpenCode (large language model assistant), used over one session. Sources were checked against Crossref, Open Library, the W3C guidelines, the AIHW workbook and the live dashboard.

The prompts below are quoted from my session. For each, the output is summarized, and the artifacts it produced are listed.

Prompt	Output produced by the tool
"…inside the figures you takes, the color doesn't match and the noting area is cropped too abrupt… I will capture the image inside the word document for you and you edit it for me with text writing inside the docs rather than inside the image."	Removed the composite figures. Rebuilt the document with APA-style figure slots: figure number, italic caption, image, and a note written as document text in the document's own colour.
"I drop 5 images with the naming of purpose inside, can you check it"	Located the five PNG files and reported that they were full browser windows, including the browser

	chrome and the Power BI footer.
“Please mark my submission before I hand it to the professor.” (assignment brief, rubric and tips supplied)	Marked the draft against the rubric with an estimated score per criterion, and listed the gaps holding each criterion below the top band.
“Along with fixing the reference, what can you do to help me get the full points”	Identified the remaining gap for each criterion. Verified Cleveland and McGill (1984) and measured text contrast from the screenshots against WCAG 1.4.3.
“If Few isn’t verified can we replace it with another source?”	Replaced Few (2012) with Heer and Bostock (2010), verified through its DOI and volume and page details.
“I want to ask if we can a tooltip but still have to hover to see the information in page 1… it still worth taking not right?” (with a screenshot of the tooltip)	Confirmed that the criticism still held, and explained why the hover-only warning strengthened it rather than weakening it.
